

# Package: tRakt (via r-universe)

September 2, 2024

**Type** Package

**Title** Get Data from 'trakt.tv'

**Version** 0.16.9000

**Description** A wrapper for the <https://trakt.tv> API to retrieve data about shows and movies, including user ratings, credits and related metadata. Additional functions retrieve user-specific information including collections and history of watched items. A full API reference is available at <https://trakt.docs.apiary.io>.

**License** MIT + file LICENSE

**URL** <https://jemus42.github.io/tRakt>, <https://github.com/jemus42/tRakt>

**BugReports** <http://github.com/jemus42/tRakt/issues>

**Depends** R (>= 4.1)

**Imports** dplyr (>= 0.7.0), httr, jsonlite (>= 0.9.14), lubridate, purrr (>= 0.2.3), rlang (>= 0.1.2), stringr, tibble, tidyselect, utils

**Suggests** covr, ggplot2, glue, kableExtra, knitr, rmarkdown, roxygen2, scales, testthat (>= 2.1.0), tidyr, yaml

**VignetteBuilder** knitr

**Encoding** UTF-8

**LazyData** true

**Roxygen** list(markdown = TRUE)

**RoxygenNote** 7.3.2

**Repository** <https://jemus42.r-universe.dev>

**RemoteUrl** <https://github.com/jemus42/tRakt>

**RemoteRef** HEAD

**RemoteSha** a3a7c4e5989d3bd0102295de1c987c4cb801e1da

## Description

These functions return the most anticipated movies/shows on trakt.tv.

## Usage

```
movies_anticipated(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)
```

```
shows_anticipated(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL,
  networks = NULL,
  status = NULL
)
```

**Arguments**

|                |   |
|----------------|---|
| limit          | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended       | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.  |
| query          | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference.   |
| years          | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .  |
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**The Dynamic Lists on trakt.tv**

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular**: Popularity is calculated using the rating percentage and the number of ratings.

- **Trending**: Returns all movies/shows being watched right now. Movies/shows with the most users are returned first.
- **Played**: Returns the most played (a single user can watch multiple times) movies/shows in the specified time period.
- **Watched**: Returns the most watched (unique users) movies/shows in the specified time period.
- **Collected**: Returns the most collected (unique users) movies/shows in the specified time period.
- **Anticipated**: Returns the most anticipated movies/shows based on the number of lists a movie/show appears on. The functions for **Played**, **Watched**, **Collected** and **Played** each return the same additional variables besides the media information: `watcher_count`, `play_count`, `collected_count`, `collector_count`.

### Source

`movies_anticipated()` wraps endpoint [movies/anticipated](#).

`shows_anticipated()` wraps endpoint [shows/anticipated](#).

### See Also

Other movie data: [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [movies\\_boxoffice\(\)](#), [movies\\_related\(\)](#), [movies\\_releases\(\)](#), [movies\\_summary\(\)](#), [people\\_media\(\)](#), [played\\_media](#), [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

Other dynamic lists: [collected\\_media](#), [lists\\_popular\(\)](#), [played\\_media](#), [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

Other shows data: [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

Other dynamic lists: [collected\\_media](#), [lists\\_popular\(\)](#), [played\\_media](#), [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

### Examples

```
## Not run:
# Get 15 the most anticipated upcoming shows on Netflix that air this year
current_year <- format(Sys.Date(), "%Y")
shows_anticipated(limit = 15, networks = "Netflix", years = current_year)

## End(Not run)
```

---

build\_trakt\_url

*Assemble a trakt.tv API URL*

---

### Description

`build_trakt_url` assembles a trakt.tv API URL from different arguments. The result should be fine for use with [trakt\\_get](#), since that's what this function was created for.

**Usage**

```
build_trakt_url(..., validate = FALSE)
```

**Arguments**

... Unnamed arguments will be concatenated with / as separators to form the path of the API URL, e.g. the arguments `movies`, `tron-legacy-2012` and `releases` will be concatenated to `movies/tron-legacy-2012/releases`. Additional **named** arguments will be used as query parameters, usually extended = "full" or others.

validate logical(1) [TRUE]: Whether to check the URL via `httr::HEAD` request.

**Value**

A URL: character of length 1. If `validate = TRUE`, also a message including the HTTP status code return by a HEAD request.

**Note**

Please be aware that the result of this function is not verified to be a working `trakt.tv` API URL unless `validate = TRUE`, in which case a HEAD request is performed that does not actually receive any data, but from its returned status code the validity of the URL can be inferred.

**See Also**

Other utility functions: [pad\\_episode\(\)](#)

**Examples**

```
build_trakt_url("shows", "breaking-bad", extended = "full")
build_trakt_url("shows", "popular", page = 3, limit = 5)

# Path can also be partially assembled already
build_trakt_url("users/jemus42", "ratings")

# Validate a URL works
build_trakt_url("shows", "popular", page = 1, limit = 5, validate = TRUE)
```

---

collected\_media

*Most collected media*

---

**Description**

These functions return the most collected movies/shows on `trakt.tv`.

**Usage**

```

movies_collected(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)

```

```

shows_collected(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL,
  networks = NULL,
  status = NULL
)

```

**Arguments**

|          |   |
|----------|---|
| limit    | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.        |
| period   | character(1) ["weekly"]: Which period to filter by. Possible values are "weekly", "monthly", "yearly", "all".   |
| query    | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference. |
| years    | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .            |

|                |   |
|----------------|---|
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

## The Dynamic Lists on trakt.tv

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular**: Popularity is calculated using the rating percentage and the number of ratings.
- **Trending**: Returns all movies/shows being watched right now. Movies/shows with the most users are returned first.
- **Played**: Returns the most played (a single user can watch multiple times) movies/shows in the specified time period.
- **Watched**: Returns the most watched (unique users) movies/shows in the specified time period.
- **Collected**: Returns the most collected (unique users) movies/shows in the specified time period.
- **Anticipated**: Returns the most anticipated movies/shows based on the number of lists a movie/show appears on. The functions for **Played**, **Watched**, **Collected** and **Played** each return the same additional variables besides the media information: `watcher_count`, `play_count`, `collected_count`, `collector_count`.

---

|                  |                             |
|------------------|-----------------------------|
| comments_comment | <i>Get a single comment</i> |
|------------------|-----------------------------|

---

**Description**

Get a single comment

**Usage**

```
comments_comment(id, extended = c("min", "full"))
```

```
comments_replies(id, extended = c("min", "full"))
```

```
comments_likes(id, extended = c("min", "full"))
```

```
comments_item(id, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

## Functions

- `comments_replies()`: Get a comment's replies
- `comments_likes()`: Get users who liked a comment.
- `comments_item()`: Get the media item attached to the comment.

## Source

`comments_comment()` wraps endpoint [comments/:id](#).

`comments_replies()` wraps endpoint [comments/:id/replies](#).

`comments_likes()` wraps endpoint [comments/:id/likes](#).

`comments_item()` wraps endpoint [comments/:id/item](#).

Other summary methods: [episodes\\_summary\(\)](#), [movies\\_summary\(\)](#), [people\\_summary\(\)](#), [seasons\\_summary\(\)](#), [shows\\_summary\(\)](#), [user\\_profile\(\)](#)

Other comment methods: [comments\\_trending\(\)](#), [comments\\_updates\(\)](#), [media\\_comments](#), [user\\_comments\(\)](#), [user\\_list\\_comments\(\)](#)

Other comment methods: [comments\\_trending\(\)](#), [comments\\_updates\(\)](#), [media\\_comments](#), [user\\_comments\(\)](#), [user\\_list\\_comments\(\)](#)

Other comment methods: [comments\\_trending\(\)](#), [comments\\_updates\(\)](#), [media\\_comments](#), [user\\_comments\(\)](#), [user\\_list\\_comments\(\)](#)

## Examples

```
# A single comment
comments_comment("236397")

# Multiple comments
comments_comment(c("236397", "112561"))
## Not run:
comments_replies("236397")

## End(Not run)
## Not run:
comments_likes("236397")

## End(Not run)
## Not run:
```

```
# A movie
comments_item("236397")
comments_item("236397", extended = "full")

# A show
comments_item("120768")
comments_item("120768", extended = "full")

# A season
comments_item("140265")
comments_item("140265", extended = "full")

# An episode
comments_item("136632")
comments_item("136632", extended = "full")

## End(Not run)
```

---

|                   |   |
|-------------------|---|
| comments_trending | <i>Get trending or recently made comments</i> |
|-------------------|---|

---

## Description

Get trending or recently made comments

## Usage

```
comments_trending(
  comment_type = c("all", "reviews", "shouts"),
  type = c("all", "movies", "shows", "seasons", "episodes", "lists"),
  include_replies = FALSE,
  limit = 10L
)

comments_recent(
  comment_type = c("all", "reviews", "shouts"),
  type = c("all", "movies", "shows", "seasons", "episodes", "lists"),
  include_replies = FALSE,
  limit = 10L
)
```

## Arguments

|                 |  |
|-----------------|--|
| comment_type    | character(1) ["all"]: The type of comment, one of "all", "reviews" or "shouts".  |
| type            | character(1) ["all"]: The type of media to filter by, one of "all", "movies", "shows", "seasons", "episodes" or "lists". |
| include_replies | logical(1) [FALSE]: Whether to include replies.  |

`limit` integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via `as.integer()`.

### Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Source

`comments_trending()` wraps endpoint `comments/trending/:comment_type/:type?include_replies=`.  
`comments_recent()` wraps endpoint `comments/recent/:comment_type/:type?include_replies=`.

### See Also

Other comment methods: `comments_comment()`, `comments_updates()`, `media_comments`, `user_comments()`, `user_list_comments()`

Other comment methods: `comments_comment()`, `comments_updates()`, `media_comments`, `user_comments()`, `user_list_comments()`

### Examples

```
## Not run:
# Trending reviews
comments_trending("reviews")

# Recent shouts (short comments)
comments_recent("shouts")

## End(Not run)
```

---

|                               |   |
|-------------------------------|---|
| <code>comments_updates</code> | <i>Get recently updated/edited comments</i> |
|-------------------------------|---|

---

### Description

Get recently updated/edited comments

### Usage

```
comments_updates(
  comment_type = c("all", "reviews", "shouts"),
  type = c("all", "movies", "shows", "seasons", "episodes", "lists"),
  include_replies = FALSE,
  limit = 10L
)
```

**Arguments**

|                              |  |
|------------------------------|--|
| <code>comment_type</code>    | character(1) ["all"]: The type of comment, one of "all", "reviews" or "shouts".  |
| <code>type</code>            | character(1) ["all"]: The type of media to filter by, one of "all", "movies", "shows", "seasons", "episodes" or "lists". |
| <code>include_replies</code> | logical(1) [FALSE]: Whether to include replies.  |
| <code>limit</code>           | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .  |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

|-------------------------------|---------------------------------------|
| <code>episodes_summary</code> | <i>Get a single episode's details</i> |
|-------------------------------|---------------------------------------|

---

**Description**

This retrieves a single episode. See [seasons\\_season](#) for a whole season, and [seasons\\_summary](#) for (potentially) all episodes of a show.

**Usage**

```
episodes_summary(id, season = 1L, episode = 1L, extended = c("min", "full"))
```

**Arguments**

|                 |   |
|-----------------|---|
| id              | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.  |
| extended        | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

`episodes_summary()` wraps endpoint `shows/:id/seasons/:season/episodes/:episode`.

**See Also**

Other episode data: `media_comments`, `media_lists`, `media_people`, `media_ratings()`, `media_stats()`, `media_translations`, `media_watching`, `seasons_season()`, `seasons_summary()`, `shows_next_episode()`  
 Other summary methods: `comments_comment()`, `movies_summary()`, `people_summary()`, `seasons_summary()`, `shows_summary()`, `user_profile()`

**Examples**

```
# Get just this one episode with its ratings, votes, etc.
episodes_summary("breaking-bad", season = 1, episode = 1, extended = "full")
```

---

 futurama

*Futurama episodes*

---

**Description**

This data comes from <https://trakt.tv> and serves as an example of episode data output.

**Usage**

```
fururama
```

**Format**

A `tibble()` with 124 rows and 18 variables:

**episode, season** Episode within each season and season number

**title** Episode title

**episode\_abs** Overall episode number

**overview** Episode summary

**rating** Rating (1-10) on trakt.tv

**votes** Number of votes on trakt.tv

**comment\_count** Number of comments on episode page

**first\_aired, updated\_at** Original air date and last update in UTC as POSIXct

**runtime** Runtime in minutes

**trakt, tvdb, tmdb** Episode IDs for trakt.tv, TVDb, and TMDb

**available\_translations** List-column of available translation on trakt.tv

**See Also**

Other Episode datasets: [gameofthrones](#)

**Examples**

```
futurama
```

---

gameofthrones

*Game of Thrones episodes*

---

**Description**

This data comes from <https://trakt.tv> and [https://en.wikipedia.org/wiki/List\\_of\\_Game\\_of\\_Thrones\\_episodes](https://en.wikipedia.org/wiki/List_of_Game_of_Thrones_episodes).

**Usage**

```
gameofthrones
```

**Format**

A `tibble()` with 67 rows and 17 variables:

**episode\_abs** Overall episode number

**episode, season** Episode within each season and season number

**title** Episode title

**overview** Episode summary

**rating** Rating (1-10) on trakt.tv

**votes** Number of votes on trakt.tv  
**viewers** Viewers according to Wikipedia  
**director, writer** Directing and writing credits  
**comment\_count** Number of comments on episode page  
**first\_aired, updated\_at** Original air date and last update in UTC as POSIXct  
**runtime** Runtime in minutes  
**trakt, tvdb, tmdb** Episode IDs for trakt.tv, TVDb, and TMDb  
**year** Year of first airing  
**epid** Episode ID in s00e00 format

### See Also

---

|               |                                     |
|---------------|-------------------------------------|
| lists_popular | <i>Get popular / trending lists</i> |
|---------------|-------------------------------------|

---

### Description

Get popular / trending lists

### Usage

```
lists_popular(limit = 10)
```

```
lists_trending(limit = 10)
```

### Arguments

**limit** integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via `as.integer()`.

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Source

`lists_popular()` wraps endpoint [lists/popular](#).  
`lists_trending()` wraps endpoint [lists/trending](#).

**See Also**

[user\\_list\\_items\(\)](#) For the actual content of a list.

**Examples**

```
## Not run:
lists_popular()
lists_trending()

## End(Not run)
```

---

media\_aliases

*Get all movie / show aliases*

---

**Description**

Get all movie / show aliases

**Usage**

```
movies_aliases(id)
```

```
shows_aliases(id)
```

**Arguments**

`id` `character(1)`: The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See `vignette("finding-things")` for more details.

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

  limit = 10L
)
```

```
seasons_comments(
  id,
  season = 1L,
  sort = c("newest", "oldest", "likes", "replies"),
```

```

    extended = c("min", "full"),
    limit = 10L
  )

  episodes_comments(
    id,
    season = 1L,
    episode = 1L,
    sort = c("newest", "oldest", "likes", "replies"),
    extended = c("min", "full"),
    limit = 10L
  )

```

## Arguments

|                 |   |
|-----------------|---|
| id              | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| sort            | character(1) ["newest"]: Comment sort order, one of "newest", "oldest", "likes" or "replies".   |
| extended        | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |
| limit           | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.  |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Functions

- `movies_comments()`: Get comments for a movie
- `shows_comments()`: Get comments for a show
- `seasons_comments()`: Get comments for a season

## End(Not run)
```

---

media\_lists

*Get lists containing a movie, show, season, episode or person*

---

**Description**

Get lists containing a movie, show, season, episode or person

**Usage**

```
movies_lists(  
  id,  
  type = c("all", "personal", "official", "watchlists"),  
  sort = c("popular", "likes", "comments", "items", "added", "updated"),  
  limit = 10L,  
  extended = c("min", "full")  
)  
  
shows_lists(  
  id,  
  type = c("all", "personal", "official", "watchlists"),  
  sort = c("popular", "likes", "comments", "items", "added", "updated"),  
  limit = 10L,  
  extended = c("min", "full")  
)  
  
seasons_lists(  
  id,  
  season,  
  type = c("all", "personal", "official", "watchlists"),  
  sort = c("popular", "likes", "comments", "items", "added", "updated"),  
  limit = 10L,  
  extended = c("min", "full")  
)  
  
episodes_lists(  
  id,  
  season,  
  episode,  
  type = c("all", "personal", "official", "watchlists"),  
  sort = c("popular", "likes", "comments", "items", "added", "updated"),  
  limit = 10L,  
  extended = c("min", "full")  
)  
  
people_lists(  
  id,  
  type = c("all", "personal", "official", "watchlists"),  
  sort = c("popular", "likes", "comments", "items", "added", "updated"),  
  limit = 10L,  
  extended = c("min", "full")  
)
```

**Arguments**

**id** character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID

(e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See `vignette("finding-things")` for more details.

|                 |  |
|-----------------|--|
| type            | character(1) ["all"]: The type of list, one of "all", "personal", "official" or "watchlists".  |
| sort            | character(1) ["popular"]: Sort lists by one of "popular", "likes", "comments", "items", "added" or "updated".  |
| limit           | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .  |
| extended        | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details. |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.         |

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Functions

- `movies_lists()`: Lists containing a movie.
- `shows_lists()`: Lists containing a show.
- `seasons_lists()`: Lists containing a season.
- `episodes_lists()`: Lists containing an episode.
- `people_lists()`: Lists containing a person.

### Source

episodes_lists("46241", season = 1, episode = 1)

## End(Not run)
## Not run:
people_lists("david-tennant")

people_lists("emilia-clarke", sort = "items")

## End(Not run)
```

---

 media\_people

 Get the cast and crew of a show or movie
 

---

### Description

Returns all cast and crew for a show/movie, depending on how much data is available.

### Usage

```
movies_people(id, extended = c("min", "full"))
```

```
shows_people(id, guest_stars = FALSE, extended = c("min", "full"))
```

```
seasons_people(
  id,
  season = 1L,
  guest_stars = FALSE,
  extended = c("min", "full")
)
```

```
episodes_people(
  id,
  season = 1L,
  episode = 1L,
  guest_stars = FALSE,
  extended = c("min", "full")
)
```

### Arguments

|                 |   |
|-----------------|---|
| id              | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| extended        | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |
| guest_stars     | logical(1) ["FALSE"]: Also include guest stars. This returns a lot of data, so use with care.   |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.  |

### Value

A list of one or more [tibbles](#) for cast and/or crew. The latter tibble objects are as flat as possible.

**Note**

As of 2019-09-30, there are two representations of character[s] and job[s]: One is a regular character variable, and the other is a list-column. The former is **deprecated** and only included for compatibility reasons.

**Source**

## End(Not run)
```

---

|               |                           |
|---------------|---------------------------|
| media_ratings | <i>Media user ratings</i> |
|---------------|---------------------------|

---

### Description

Returns a movie's or show's (or season's, or episode's) rating and ratings distribution. If you *do not* want the full ratings distribution, it is highly advised to just use \*\_summary functions or [seasons\\_season](#) for episode ratings.

### Usage

```
shows_ratings(id)

movies_ratings(id)

seasons_ratings(id, season = 1L)

episodes_ratings(id, season = 1L, episode = 1L)
```

### Arguments

|                 |   |
|-----------------|---|
| id              | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.  |

### Value

A [tibble\(\)](#). If the function has a limit parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty tibble() is returned.

### Note

Since this function is able to work on multi-length inputs for id, season and episode, it is possible to get a lot of data, *but* at the cost of one API call *per element in each argument*. Please be kind to the API.

### Source

```
shows_ratings() wraps endpoint shows/:ids/ratings.

### Examples

```
# A movie's ratings
movies_ratings("tron-legacy-2010")

# A show's ratings
shows_ratings("game-of-thrones")
## Not run:
# Ratings for seasons 1 through 5
seasons_ratings("futurama", season = 1:5)

# Ratings for episodes 1 through 7 of season 1
episodes_ratings("futurama", season = 1, episode = 1:7)

## End(Not run)
```

---

media\_stats

*Get a show or movie's (or season's or episode's) stats*

---

### Description

The data contains watchers, plays, collectors, comments, lists, and votes.

### Usage

```
shows_stats(id)
```

```
movies_stats(id)
```

```
seasons_stats(id, season = 1L)
```

```
episodes_stats(id, season = 1L, episode = 1L)
```

**Arguments**

- `id` `character(1)`: The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all `id` values separately and the result is combined. See `vignette("finding-things")` for more details.
- `season, episode` `integer(1) [1L]`: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in *a lot* of API calls. Use wisely.

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

- `shows_stats()` wraps endpoint [shows/:id/stats](#).
- `movies_stats()` wraps endpoint [movies/:id/stats](#).
- `seasons_stats()` wraps endpoint [shows/:id/seasons/:season/stats](#).
- `episodes_stats()` wraps endpoint [shows/:id/seasons/:season/episodes/:episode/stats](#).

**See Also**

Other show data: [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_translations](#), [media\\_watching](#), [people\\_media\(\)](#), [played\\_media](#), [shows\\_next\\_episode\(\)](#), [shows\\_related\(\)](#), [shows\\_summary\(\)](#)

Other movie data: [anticipated\\_media](#), [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_translations](#), [media\\_watching](#), [movies\\_boxoffice\(\)](#), [movies\\_related\(\)](#), [movies\\_releases\(\)](#), [movies\\_summary\(\)](#), [people\\_media\(\)](#), [played\\_media](#), [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

Other season data: [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [seasons\\_season\(\)](#), [seasons\\_summary\(\)](#)

**Examples**

```
# Stats for a movie
movies_stats("inception-2010")
## Not run:
# Stats for multiple shows at once
shows_stats(c("breaking-bad", "game-of-thrones"))

# Stats for multiple episodes
episodes_stats("futurama", season = 1, episode = 1:7)
```

```
## End(Not run)
```

---

```
media_translations      Get translations for a movie, show or episode
```

---

## Description

Get translations for a movie, show or episode

## Usage

```
movies_translations(id, languages = NULL)
```

```
shows_translations(id, languages = NULL)
```

```
episodes_translations(id, season = 1L, episode = 1L, languages = NULL)
```

## Arguments

|                 |   |
|-----------------|---|
| id              | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| languages       | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| season, episode | integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in <i>a lot</i> of API calls. Use wisely.  |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

movies_translations("193972")

# Only get a specific language
movies_translations("193972", "de")
```

---

media\_watching

*Get who's watching a thing right now*

---

**Description**

Get who's watching a thing right now

**Usage**

```
movies_watching(id, extended = c("min", "full"))

shows_watching(id, extended = c("min", "full"))

seasons_watching(id, season = 1L, extended = c("min", "full"))

episodes_watching(id, season = 1L, episode = 1L, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See <a href="#">vignette("finding-things")</a> for more details. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <a href="#">vignette("finding-things")</a> for more details.   |

season, episode integer(1) [1L]: The season and episode number. If longer, e.g. 1:5, the function is vectorized and the output will be combined. This may result in *a lot* of API calls. Use wisely.

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty tibble() is returned.

### Functions

- `movies_watching()`: Who's watching a movie.
- `shows_watching()`: Who's watching a show.
- `seasons_watching()`: Who's watching a season.
- `episodes_watching()`: Who's watching an episode.

### Source

### Examples

```
## Not run:
movies_watching("deadpool-2016")
shows_watching("the-simpsons")
seasons_watching("the-simpsons", season = 6)
episodes_watching("the-simpsons", season = 6, episode = 12)

## End(Not run)
```

---

|                  |                                   |
|------------------|-----------------------------------|
| movies_boxoffice | <i>Get the weekend box office</i> |
|------------------|-----------------------------------|

---

### Description

Returns the top 10 grossing movies in the U.S. box office last weekend. Updated every Monday morning.

### Usage

```
movies_boxoffice(extended = c("min", "full"))
```

### Arguments

|          |  |
|----------|--|
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details. |
|----------|--|

### Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Source

`movies_boxoffice()` wraps endpoint [movies/boxoffice](#).

### See Also

Other movie data: [anticipated\\_media](#), [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [movies\\_related\(\)](#), [movies\\_releases\(\)](#), [movies\\_summary\(\)](#), [people\\_media\(\)](#), [played\\_media](#), [popular\\_media](#), [trending\\_media](#), [watched\\_media](#)

### Examples

```
movies_boxoffice()
```

---

|                |                                |
|----------------|--------------------------------|
| movies_related | <i>Get similar(ish) movies</i> |
|----------------|--------------------------------|

---

**Description**

Get similar(ish) movies

**Usage**

```
movies_related(id, limit = 10L, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| limit    | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

**Examples**

```
movies_related("the-avengers-2012", limit = 5)
```

---

|                 |                                      |
|-----------------|--------------------------------------|
| movies_releases | <i>Get a movie's release details</i> |
|-----------------|--------------------------------------|

---

### Description

Retrieve one or more movie's release information, including the release date, country code (two letter, e.g. us), and the certification (e.g. PG).

### Usage

```
movies_releases(id, country = NULL)
```

### Arguments

|         |   |
|---------|---|
| id      | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| country | Optional two letter country code to filter by. See <a href="#">trakt_countries</a> for a table of country codes.  |

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

### Source

```

```
movies_summary(c("inception-2010", "the-dark-knight-2008"), extended = "full")  
## End(Not run)
```

---

pad\_episode

*Easy episode number padding*

---

### Description

Simple function to ease the creation of sXXeYY episode ids. Note that s and e must have the same length.

### Usage

```
pad_episode(s = "0", e = "0", s_width = 2, e_width = 2)
```

### Arguments

|         |  |
|---------|--|
| s       | Input season number, coerced to character.               |
| e       | Input episode number, coerced to character.              |
| s_width | The length of the season number padding. Defaults to 2.  |
| e_width | The length of the episode number padding. Defaults to 2. |

### Value

A character in the common sXXeYY format

### Note

I like my sXXeYY format, okay?

### See Also

Other utility functions: [build\\_trakt\\_url\(\)](#)

### Examples

```
# Season 2, episode 4  
pad_episode(2, 4)  
pad_episode(1, 85, e_width = 3)
```

---

people\_media                      *Get a single person's movie or show credits*

---

### Description

Returns all movies or shows where this person is in the cast or crew.

### Usage

```
people_movies(id, extended = c("min", "full"))
```

```
people_shows(id, extended = c("min", "full"))
```

### Arguments

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

### Details

Note that as of 2019-09-30, there are two representations of character[s] and job[s]: One is a regular character variable, and the other is a list-column. The singular is **deprecated and only included for compatibility reasons**.

### Value

A list of one or more [tibbles](#) for cast and crew. The latter tibble objects are as flat as possible.

### Source

people\_movies() wraps endpoint [people/:id/movies](#).

people\_shows() wraps endpoint [people/:id/shows](#).

### See Also

Other show data: `collected_media`, `media_aliases`, `media_comments`, `media_lists`, `media_people`, `media_ratings()`, `media_stats()`, `media_translations`, `media_watching`, `played_media`, `shows_next_episode()`, `shows_related()`, `shows_summary()`

Other people data: `media_lists`, `media_people`, `people_summary()`

## Examples

```
## Not run:
people_movies("christopher-nolan")

people_shows("kit-harington")

## End(Not run)
```

---

|                |                                      |
|----------------|--------------------------------------|
| people_summary | <i>Get a single person's details</i> |
|----------------|--------------------------------------|

---

## Description

Get a single person's details, like their various IDs. If extended is "full", there will also be biographical data if available, e.g. their birthday.

## Usage

```
people_summary(id, extended = c("min", "full"))
```

## Arguments

|          |  |
|----------|--|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See <code>vignette("finding-things")</code> for more details. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.   |

## Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Source

`people_summary()` wraps endpoint `people/:id`.

Other summary methods: [comments\\_comment](#)(), [episodes\\_summary](#)(), [movies\\_summary](#)(), [seasons\\_summary](#)(), [shows\\_summary](#)(), [user\\_profile](#)()

**Examples**

```
# A single person's extended information
people_summary("bryan-cranston", "full")

# Multiple people
people_summary(c("kit-harington", "emilia-clarke"))
```

---

|              |                          |
|--------------|--------------------------|
| played_media | <i>Most played media</i> |
|--------------|--------------------------|

---

**Description**

These functions return the most played movies/shows on trakt.tv.

**Usage**

```
movies_played(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)
```

```
shows_played(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
```

```

certifications = NULL,
networks = NULL,
status = NULL
)

```

### Arguments

|                |   |
|----------------|---|
| limit          | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended       | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.  |
| period         | character(1) ["weekly"]: Which period to filter by. Possible values are "weekly", "monthly", "yearly", "all".   |
| query          | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference.   |
| years          | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .  |
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### The Dynamic Lists on trakt.tv

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular**: Popularity is calculated using the rating percentage and the number of ratings.
- **Trending**: Returns all movies/shows being watched right now. Movies/shows with the most users are returned first.
- **Played**: Returns the most played (a single user can watch multiple times) movies/shows in the specified time period.
- **Watched**: Returns the most watched (unique users) movies/shows in the specified time period.
- **Collected**: Returns the most collected (unique users) movies/shows in the specified time period.
- **Anticipated**: Returns the most anticipated movies/shows based on the number of lists a movie/show appears on. The functions for **Played**, **Watched**, **Collected** and **Played** each return the same additional variables besides the media information: `watcher_count`, `play_count`, `collected_count`, `collector_count`.

### Source

popular\_media

*Popular media*

---

### Description

These functions return the popular movies/shows on trakt.tv.

**Usage**

```
movies_popular(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)
```

```
shows_popular(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL,
  networks = NULL,
  status = NULL
)
```

**Arguments**

|           |   |
|-----------|---|
| limit     | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended  | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.        |
| query     | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference. |
| years     | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .            |
| genres    | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |

|                |   |
|----------------|---|
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

### Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

### The Dynamic Lists on trakt.tv

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular**: Popularity is calculated using the rating percentage and the number of ratings.

**Examples**

```
## Not run:
# Get the most popular German-language movies between 2000 and 2010
movies_popular(languages = "de", years = c(2000, 2010))

## End(Not run)
```

---

search\_query

*Search trakt.tv via text query or ID*

---

**Description**

Search for a show or movie with a keyword (e.g. "Breaking Bad") and receive basic info of the first search result. It's main use is to retrieve the IDs or proper show/movie title for further use, as well as receiving a quick overview of a show/movie.

**Usage**

```
search_query(
  query,
  type = "show",
  n_results = 1L,
  extended = c("min", "full"),
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL,
  networks = NULL,
  status = NULL
)
```

```

search_id(
  id,
  id_type = c("trakt", "imdb", "tmdb", "tvdb"),
  type = "show",
  n_results = 1L,
  extended = c("min", "full")
)

```

## Arguments

|                |  |
|----------------|--|
| query          | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference.  |
| type           | character(1) ["show"]: The type of data you're looking for. One of show, movie, episode, person or list or a character vector with those elements, e.g. <code>c("show", "movie")</code> . Note that not every combination is reasonably combinable, e.g. <code>c("movie", "list")</code> . Use separate function calls in that case. |
| n_results      | integer(1) [1]: How many results to return.  |
| extended       | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.   |
| years          | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .   |
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.   |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).   |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .  |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.  |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100.  |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.   |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.   |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".   |
| id             | character(1): The id used for the search, e.g. 14701 for a Trakt ID.   |
| id_type        | character(1) ["trakt"]: The type of id. One of trakt, imdb, tmdb, tvdb.  |

## Details

The amount of information returned is equal to \*\_summary API methods and in turn depends on the value of extended. See also the [API reference here](#) for which fields of the item metadata are searched by default.

## Value

A [tibble](#) containing n\_results results. Variable type is equivalent to the value of the type argument, and variable score indicates the search match, where 1000 is a perfect match. If no results are found, the tibble has 0 rows. If more than one type is specified, e.g. c("movie", "show"), there will be n\_results results *per type*.

## Source

search\_query() wraps endpoint [search/:type?query=](#).

search\_id() wraps endpoint [search/:id\\_type/:id?type=](#).

## Examples

```
# A show
search_query("Breaking Bad", type = "show", n_results = 3)
## Not run:
# A show by its trakt id, and now with more information
search_id(1388, "trakt", type = "show", extended = "full")

# A person
search_query("J. K. Simmons", type = "person", extended = "full")

# A movie or a show, two of each
search_query("Tron", type = c("movie", "show"), n_results = 2)

## End(Not run)
```

---

seasons\_season

*Get a season of a show*

---

## Description

Similar to [seasons\\_summary](#), but this function returns full data for a single season, i.e. all the episodes of the season

## Usage

```
seasons_season(id, seasons = 1L, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| seasons  | integer(1) [1L]: The season(s) to get. Use 0 for specials.  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty tibble() is returned.

**Note**

If you want to quickly gather episode data of all available seasons, see [seasons\\_summary](#) and use the `episodes = TRUE` parameter.

**Source**

`seasons_season()` wraps endpoint [shows/id/seasons/season](#).

**See Also**

Other season data: [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [seasons\\_summary\(\)](#)

Other episode data: [episodes\\_summary\(\)](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [seasons\\_summary\(\)](#), [shows\\_next\\_episode\(\)](#)

**Examples**

```
## Not run:
seasons_season("breaking-bad", 1)

# Including all episode data:
seasons_season("breaking-bad", 1, extended = "full")

## End(Not run)
```

---

seasons\_summary      *Get a show's seasons*

---

### Description

Get details for a show's seasons, e.g. how many seasons there are and how many episodes each season has. With `episodes == TRUE` and `extended == "full"`, this function is also suitable to retrieve all episode data for all seasons of a show with just a single API call.

### Usage

```
seasons_summary(
  id,
  episodes = FALSE,
  drop_specials = TRUE,
  drop_unaired = TRUE,
  extended = c("min", "full")
)
```

### Arguments

|                            |  |
|----------------------------|--|
| <code>id</code>            | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See <code>vignette("finding-things")</code> for more details. |
| <code>episodes</code>      | logical(1) [FALSE]: If TRUE, all episodes for each season are appended as a list-column, with the amount of variables depending on <code>extended</code> .   |
| <code>drop_specials</code> | logical(1) [TRUE]: Special episodes (season 0) are dropped   |
| <code>drop_unaired</code>  | logical(1) [TRUE]: Seasons without aired episodes are dropped. Only works if <code>extended</code> is "full".  |
| <code>extended</code>      | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.   |

### Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Source

`seasons_summary()` wraps endpoint `shows/:id/seasons`.

**See Also**

Other season data: [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [seasons\\_season\(\)](#)

Other episode data: [episodes\\_summary\(\)](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [seasons\\_season\(\)](#), [shows\\_next\\_episode\(\)](#)

Other summary methods: [comments\\_comment\(\)](#), [episodes\\_summary\(\)](#), [movies\\_summary\(\)](#), [people\\_summary\(\)](#), [shows\\_summary\(\)](#), [user\\_profile\(\)](#)

**Examples**

```
# Get just the season numbers and their IDs
seasons_summary("breaking-bad", extended = "min")
## Not run:
# Get season numbers, ratings, votes, titles and other metadata as well as
# a list-column containing all episode data
seasons_summary("utopia", extended = "full", episodes = TRUE)

## End(Not run)
```

---

shows\_next\_episode      *Get a shows next or latest episode*

---

**Description**

Get a shows next or latest episode

**Usage**

```
shows_next_episode(id, extended = c("min", "full"))
```

```
shows_last_episode(id, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See <a href="#">vignette("finding-things")</a> for more details. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <a href="#">vignette("finding-things")</a> for more details.   |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

**Source**

Other show data: [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [people\\_media\(\)](#), [played\\_media](#), [shows\\_related\(\)](#), [shows\\_summary\(\)](#)

Other episode data: [episodes\\_summary\(\)](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [seasons\\_season\(\)](#), [seasons\\_summary\(\)](#)

**Examples**

```
shows_next_episode("one-piece")
shows_last_episode("one-piece", extended = "full")
```

---

shows\_related

*Get similiar(ish) shows*

---

**Description**

Get similiar(ish) shows

**Usage**

```
shows_related(id, limit = 10L, extended = c("min", "full"))
```

**Arguments**

|          |   |
|----------|---|
| id       | character(1): The ID of the item requested. Preferably the trakt ID (e.g. 1429). Other options are the trakt.tv slug (e.g. "the-wire") or imdb ID (e.g. "tt0306414"). Can also be of length greater than 1, in which case the function is called on all id values separately and the result is combined. See vignette("finding-things") for more details. |
| limit    | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See vignette("finding-things") for more details.   |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

`shows_related()` wraps endpoint [shows/:id/related](#).

**See Also**

```
# Minimal info by default
shows_summary("breaking-bad")
## Not run:
# More information
shows_summary("breaking-bad", extended = "full")

## End(Not run)
```

---

trakt\_credentials      *Set the required trakt.tv API credentials*

---

**Description**

trakt\_credentials searches for your credentials and stores them in the appropriate [environment variables](#) of the same name. To make this work automatically, place your key as environment variables in ~/.Renviron (see Details). Arguments to this function take precedence over any configuration file.

**Usage**

```
trakt_credentials(username, client_id, client_secret, silent = TRUE)
```

**Arguments**

|               |   |
|---------------|---|
| username      | character(1): Explicitly set your trakt.tv username (optional).   |
| client_id     | character(1): Explicitly set your API client ID (required for <i>any</i> API interaction).                    |
| client_secret | character(1): Explicitly set your API client secret (required only for <i>authenticated</i> API interaction). |
| silent        | logical(1) [TRUE]: No messages are printed showing you the API information. Mostly for debug purposes.        |

## Details

This function is called automatically when the package is loaded via `library(tRakt)` or `tRakt::fun` function calls – you basically never have to use it if you have stored your credentials as advised. Additionally, for regular (non-authenticated) API interaction, you do not have to set any credentials at all because the package's `client_secret` is used as a fallback, which allows you to use most functions out of the box.

Set appropriate values in your `~/ .Renvi ron` like this:

```
# tRakt
trakt_username=jemus42
trakt_client_id=12[...]f2
trakt_client_secret=f23[...]2nkjb
```

If (and only if) the environment option `trakt_client_secret` is set to a non-empty string (i.e. it's not `""`), then all requests will be made using authentication.

## Value

Invisibly: A list with elements `username`, `client_id` and `client_secret`, where values are `TRUE` if the corresponding value is non-empty.

## See Also

Other API-basics: [trakt\\_get\(\)](#), [trakt\\_get\\_token\(\)](#)

## Examples

```
## Not run:
# Use a values set in ~/ .Renvi ron in an R session:
# (This is automatically executed when calling library(tRakt))
trakt_credentials(silent = FALSE)

# Explicitly set values in an R session, overriding .Renvi ron values
trakt_credentials(
  username = "jemus42",
  client_id = "totallylegitclientsecret",
  silent = FALSE
)

## End(Not run)
```

---

trakt\_datasets

*Cached filter datasets*

---

## Description

These datasets are used internally to check the optional **filter parameters** for certain functions (see [search\\_query](#) or the dynamic lists like [shows\\_popular](#)). They are unlikely to change often and are therefore included as package datasets.

## Usage

trakt\_genres

trakt\_languages

trakt\_networks

trakt\_countries

trakt\_certifications

## Format

Every dataset is a [tibble\(\)](#). The following list includes the dataset topic with a link to the API documentation, a short description and a list of variables with example values:

- **Genres:** Genres for shows and movies (with their two-letter codes) trakt.tv knows.
  - 3 Variables: name ("Action"), slug ("action"), type ("movies")
- **Languages:** Languages (and two-letter codes) trakt.tv knows.
  - 3 Variables: name ("Arabic"), code ("ar"), type ("movies")
- **Networks:** TV networks trakt.tv knows.
  - 2 Variables: name ("TBS"), name\_clean ("tbs") (lower-case, no trailing whitespaces)
- **Countries:** Country names (and two-letter codes).
  - 3 Variables: name ("Belarus"), code ("by"), type ("movies")
- **Certifications:** TV and movie certifications (e.g. "PG-13" and the likes).
  - 5 Variables: country ("us" only), name ("TV-PG"), slug ("tv-pg"), description ("Parental Guidance Suggested"), type ("shows")

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 64 rows and 3 columns.

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 244 rows and 3 columns.

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 3081 rows and 2 columns.

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 350 rows and 3 columns.

An object of class `tbl_df` (inherits from `tbl`, `data.frame`) with 12 rows and 5 columns.

## Details

The datasets are prefixed with `trakt_` purely to avoid confusion or masking for filter arguments of the same name.

## Note

Currently only US certifications are available.

**Examples**

```
head(trakt_genres)
head(trakt_languages)
head(trakt_networks)
head(trakt_countries)
trakt_certifications
```

trakt\_get

*Make an API call and receive parsed output***Description**

The most basic form of API interaction: Querying a specific URL and getting its parsed result. If the response is empty, the function returns an empty `tibble()`, and if there are date-time variables present in the response, they are converted to POSIXct via `lubridate::ymd_hms()` or to Date via `lubridate::as_date()` if the variable only contains date information.

**Usage**

```
trakt_get(url, client_id = Sys.getenv("trakt_client_id"), HEAD = FALSE)
```

**Arguments**

|           |  |
|-----------|--|
| url       | character(1): The API endpoint. Either a full URL like "https://api.trakt.tv/shows/breaking-bad" or just the endpoint like shows/breaking-bad.   |
| client_id | character(1): API client ID. If no value is set, this defaults to the package's client ID. See <a href="#">trakt_credentials</a> for further information.  |
| HEAD      | logical(1) [FALSE]: If TRUE, only a HTTP HEAD request is performed and its content returned. This is useful if you are only interested in status codes or other headers, and don't want to waste resources/bandwidth on the response body. |

**Details**

See [the official API reference](#) for a detailed overview of available methods. Most methods of potential interest for data collection have dedicated functions in this package.

**Value**

The parsed (`jsonlite::fromJSON()`) content of the API response. An empty `tibble()` if the response is an empty JSON array.

**Note**

No OAuth2 methods are supported yet, meaning you don't have access to POST methods or user information of non-public profiles.

**See Also**

Other API-basics: [trakt\\_credentials\(\)](#), [trakt\\_get\\_token\(\)](#)

**Examples**

```
# A simple request to a direct URL
trakt_get("https://api.trakt.tv/shows/breaking-bad")

# A HEAD-only request
# useful for validating a URL exists or the API is accessible
trakt_get("https://api.trakt.tv/users/jemus42", HEAD = TRUE)

# Optionally be lazy about URL specification by dropping the hostname:
trakt_get("shows/game-of-thrones")
```

---

trending\_media

*Trending media*

---

**Description**

These functions return the trending movies/shows on trakt.tv.

**Usage**

```
movies_trending(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)

shows_trending(
  limit = 10,
  extended = c("min", "full"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
```

```

    certifications = NULL,
    networks = NULL,
    status = NULL
  )

```

## Arguments

|                |   |
|----------------|---|
| limit          | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .   |
| extended       | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.  |
| query          | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference.   |
| years          | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .  |
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### The Dynamic Lists on trakt.tv

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular:** Popularity is calculated using the rating percentage and the number of ratings.
- **Trending:** Returns all movies/shows being watched right now. Movies/shows with the most users are returned first.
- **Played:** Returns the most played (a single user can watch multiple times) movies/shows in the specified time period.
- **Watched:** Returns the most watched (unique users) movies/shows in the specified time period.
- **Collected:** Returns the most collected (unique users) movies/shows in the specified time period.
- **Anticipated:** Returns the most anticipated movies/shows based on the number of lists a movie/show appears on. The functions for **Played**, **Watched**, **Collected** and **Played** each return the same additional variables besides the media information: `watcher_count`, `play_count`, `collected_count`, `collector_count`.

### Source

`movies_trending()` wraps endpoint [movies/trending](#).

`shows_trending()` wraps endpoint [shows/trending](#).

### See Also

Other movie data: [anticipated\\_media](#), [collected\\_media](#), [media\\_aliases](#), [media\\_comments](#), [media\\_lists](#), [media\\_people](#), [media\\_ratings\(\)](#), [media\\_stats\(\)](#), [media\\_translations](#), [media\\_watching](#), [movies\\_boxoffice\(\)](#), [movies\\_related\(\)](#), [movies\\_releases\(\)](#), [movies\\_summary\(\)](#), [people\\_media\(\)](#), [played\\_media](#), [popular\\_media](#), [watched\\_media](#)

Other dynamic lists: [anticipated\\_media](#), [collected\\_media](#), [lists\\_popular\(\)](#), [played\\_media](#), [popular\\_media](#), [watched\\_media](#)

Other shows data: [anticipated\\_media](#), [popular\\_media](#), [watched\\_media](#)

Other dynamic lists: [anticipated\\_media](#), [collected\\_media](#), [lists\\_popular\(\)](#), [played\\_media](#), [popular\\_media](#), [watched\\_media](#)

---

user\_collection

*Get a user's collected shows or movies*

---

### Description

Get a user's collected shows or movies

## Usage

```
user_collection(  
  user = getOption("trakt_username"),  
  type = c("shows", "movies"),  
  unnest_episodes = FALSE,  
  extended = c("min", "full")  
)
```

## Arguments

|                 |  |
|-----------------|--|
| user            | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| type            | character(1): Either "shows" or "movies". For season/episode-specific functions, values seasons or episodes are also allowed.  |
| unnest_episodes | logical(1) [FALSE]: Unnests episode data using <code>tidyr::unnest()</code> and returns one row per episode rather than one row per show.  |
| extended        | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

## Details

This function wraps the API method `/users/:user_id/collection/:type`.

## Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Note

The `extended = "metadata"` API parameter is not implemented. This would add media information `media_type`, `resolution`, `audio`, `audio_channels` and `3D` to the output, which may or may not be available. If this feature is important to you, please open an issue on GitHub.

## Source

`user_collection()` wraps endpoint `users/:id/collection/:type`.

## See Also

Other user data: `user_comments()`, `user_history()`, `user_likes()`, `user_network()`, `user_profile()`, `user_ratings()`, `user_stats()`, `user_watched()`, `user_watchlist()`

## Examples

```
## Not run:
user_collection(user = "sean", type = "movies")
user_collection(user = "sean", type = "shows")

## End(Not run)
```

---

 user\_comments

*Get a user's comments*

---

## Description

Get a user's comments

## Usage

```
user_comments(
  user = getOption("trakt_username"),
  comment_type = c("all", "reviews", "shouts"),
  type = c("all", "movies", "shows", "seasons", "episodes", "lists"),
  include_replies = FALSE
)
```

## Arguments

|                 |  |
|-----------------|--|
| user            | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| comment_type    | character(1) ["all"]: The type of comment, one of "all", "reviews" or "shouts".  |
| type            | character(1) ["all"]: The type of media to filter by, one of "all", "movies", "shows", "seasons", "episodes" or "lists".   |
| include_replies | logical(1) [FALSE]: Whether to include replies.  |

## Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Source

`user_comments()` wraps endpoint `users/:id/comments/:comment_type/:type?include_replies=.`

**See Also**

Other user data: [user\\_collection\(\)](#), [user\\_history\(\)](#), [user\\_likes\(\)](#), [user\\_network\(\)](#), [user\\_profile\(\)](#), [user\\_ratings\(\)](#), [user\\_stats\(\)](#), [user\\_watched\(\)](#), [user\\_watchlist\(\)](#)

Other comment methods: [comments\\_comment\(\)](#), [comments\\_trending\(\)](#), [comments\\_updates\(\)](#), [media\\_comments](#), [user\\_list\\_comments\(\)](#)

**Examples**

```
## Not run:
user_comments("jemus42")

## End(Not run)
```

---

|              |                                   |
|--------------|-----------------------------------|
| user_history | <i>Get a user's watch history</i> |
|--------------|-----------------------------------|

---

**Description**

Retrieve a the last `limit` items a user has watched, including the method by which it was logged (e.g. *scrobble* or *checkin*).

**Usage**

```
user_history(
  user = getOption("trakt_username"),
  type = c("shows", "movies"),
  limit = 10L,
  start_at = NULL,
  end_at = NULL,
  extended = c("min", "full")
)
```

**Arguments**

|                  |  |
|------------------|--|
| user             | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| type             | character(1): Either "shows" or "movies". For season/episode-specific functions, values seasons or episodes are also allowed.  |
| limit            | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .  |
| start_at, end_at | character(1): A time-window to filter by. Must be coercible to a datetime object of class <code>POSIXct</code> . See <a href="#">ISOdate</a> for further information.  |
| extended         | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

**Details**

This function wraps the API method `/users/:id/history/:type`.

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the `tibble`. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Note**

For `type = "shows"`, the original output contains a nested object with `show` and `episode` data, which are unnested by this function. Due to duplicate variable names, all episode-related variables are prefixed with `episode_`. This results in the episode number having the name `episode_episode`, which is quite silly. Sorry.

**Source**

`user_history()` wraps endpoint `users/:id/history/:type/:item_id?start_at=&end_at=`.

**See Also**

Other user data: `user_collection()`, `user_comments()`, `user_likes()`, `user_network()`, `user_profile()`, `user_ratings()`, `user_stats()`, `user_watched()`, `user_watchlist()`

**Examples**

```
## Not run:
# Shows user "jemus42" watched around christmas 2016
user_history(
  user = "jemus42", type = "shows", limit = 5,
  start_at = "2015-12-24", end_at = "2015-12-28"
)

## End(Not run)
```

---

user\_likes

*Get items (comments, lists) a user likes*

---

**Description**

Get items (comments, lists) a user likes

**Usage**

```
user_likes(type = c("comments", "lists"))
```

## Arguments

type character(1) ["comments"]: One of "comments", "lists".

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

## Source

`user_likes()` wraps endpoint [users/likes/:type](#) (Authentication required).

## See Also

Other user data: [user\\_collection\(\)](#), [user\\_comments\(\)](#), [user\\_history\(\)](#), [user\\_network\(\)](#), [user\\_profile\(\)](#), [user\\_ratings\(\)](#), [user\\_stats\(\)](#), [user\\_watched\(\)](#), [user\\_watchlist\(\)](#)

## Examples

```
# Get liked lists (only if there's a client secret set)
# See ?trakt_credentials
if (trakt_credentials()[["client_secret"]]) {
  user_likes("lists")
}
```

---

user\_list

*Get a single list*

---

## Description

Retrieve a single list a user has created together with information about the user. Use `extended = "full"` to retrieve all user profile data, similar to [user\\_profile](#). The returned variables `trakt` (list ID) or `slug` (list slug) can be used to retrieve the list's items via [user\\_list\\_items](#).

## Usage

```
user_list(
  user = getOption("trakt_username"),
  list_id,
  extended = c("min", "full")
)
```

**Arguments**

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| list_id  | The list identifier, either trakt ID or slug of the list. Can be obtained via the website (URL slug) or e.g. <a href="#">user_lists</a> .  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Note**

In the embedded user data, `name` is renamed to `user_name` due to duplication with e.g. list names, and `slug` is renamed to `user_slug` for the same reason.

**See Also**

[user\\_list](#) for only a single list.

[user\\_list\\_items](#) For the actual content of a list.

Other list methods: [lists\\_popular\(\)](#), [media\\_lists](#), [user\\_list\\_comments\(\)](#), [user\\_list\\_items\(\)](#), [user\\_lists\(\)](#)

**Examples**

```
## Not run:
user_list("jemus42", list_id = 2121308)

## End(Not run)
```

---

user\_lists

*Get a user's lists*

---

**Description**

Retrieve all lists a user has created together with information about the user. Use `extended = "full"` to retrieve all user profile data, similar to [user\\_profile](#). The returned variables `trakt` (list ID) or `slug` (list slug) can be used to retrieve the list's items via [user\\_list\\_items](#).

**Usage**

```
user_lists(user = getOption("trakt_username"), extended = c("min", "full"))
```

### Arguments

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

### Value

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

### Note

In the embedded user data, `name` is renamed to `user_name` due to duplication with e.g. list names, and `slug` is renamed to `user_slug` for the same reason.

### Source

`user_lists()` wraps endpoint [users/:id/lists](#).

### See Also

[user\\_lists](#) for all lists a user has.

[user\\_list\\_items](#) For the actual content of a list.

Other list methods: [lists\\_popular\(\)](#), [media\\_lists](#), [user\\_list\(\)](#), [user\\_list\\_comments\(\)](#), [user\\_list\\_items\(\)](#)

### Examples

```
## Not run:  
user_lists("jemus42")  
  
## End(Not run)
```

---

|                                 |  |
|---------------------------------|--|
| <code>user_list_comments</code> | <i>Get comments on a user-created list</i> |
|---------------------------------|--|

---

### Description

Get comments on a user-created list

**Usage**

```

user_list_comments(
  user = getOption("trakt_username"),
  list_id,
  sort = c("newest", "oldest", "likes", "replies"),
  extended = c("min", "full")
)

```

**Arguments**

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| list_id  | The list identifier, either trakt ID or slug of the list. Can be obtained via the website (URL slug) or e.g. <a href="#">user_lists</a> .  |
| sort     | character(1) ["newest"]: Comment sort order, one of "newest", "oldest", "likes" or "replies".  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

**Value**

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

`user_list_comments()` wraps endpoint [users/:id/lists/:list\\_id/comments/:sort](#).

**See Also**

**Examples**

```

## Not run:
user_list_comments("donxy", "1248149")

## End(Not run)

```

---

|                 |                                  |
|-----------------|----------------------------------|
| user_list_items | <i>Get a user's list's items</i> |
|-----------------|----------------------------------|

---

## Description

Get a user's list's items

## Usage

```
user_list_items(  
  user = getOption("trakt_username"),  
  list_id,  
  type = NULL,  
  extended = c("min", "full")  
)
```

## Arguments

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| list_id  | The list identifier, either trakt ID or slug of the list. Can be obtained via the website (URL slug) or e.g. <a href="#">user_lists</a> .  |
| type     | character(1) [NULL]: If not NULL, only items of that media type are returned. Possible values are "movie", "show", "season", "episode", "person".  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Source

`user_list_items()` wraps endpoint [users/:id/lists/:list\\_id/items/:type](#).

## See Also

Other list methods: [lists\\_popular\(\)](#), [media\\_lists](#), [user\\_list\(\)](#), [user\\_list\\_comments\(\)](#), [user\\_lists\(\)](#)

## Examples

```
## Not run:
# A large list with various media types
# All items
user_list_items("sp1ti", list_id = "5615781", extended = "min")

# Movies only
user_list_items("sp1ti", list_id = "5615781", extended = "min", type = "movie")

# Shows...
user_list_items("sp1ti", list_id = "5615781", extended = "min", type = "shows")

# Only seasons
user_list_items("sp1ti", list_id = "5615781", extended = "min", type = "season")

# Only episodes
user_list_items("sp1ti", list_id = "5615781", extended = "min", type = "episodes")

## End(Not run)
```

---

user\_network

*Get a user's social connections*

---

## Description

Get followers, followings or friends (the two-way relationship).

## Usage

```
user_followers(user = getOption("trakt_user"), extended = "min")
```

```
user_following(user = getOption("trakt_user"), extended = "min")
```

```
user_friends(user = getOption("trakt_user"), extended = "min")
```

## Arguments

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Note**

If the specified user is private, you need to be able to make an [authenticated request](#) and be friends with the user.

```

---

`user_ratings`*Get a user's ratings*

---

**Description**

Retrieve a user's media ratings

**Usage**

```
user_ratings(  
  user = getOption("trakt_username"),  
  type = c("movies", "seasons", "shows", "episodes"),  
  rating = NULL,  
  extended = c("min", "full")  
)
```

**Arguments**

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| type     | character(1): Either "shows" or "movies". For season/episode-specific functions, values seasons or episodes are also allowed.  |
| rating   | integer(1) [NULL]: Optional rating between 1 and 10 to filter by.  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

```
## Not run:
user_ratings(user = "jemus42", "shows")
user_ratings(user = "sean", type = "movies")

## End(Not run)
```

---

|            |  |
|------------|--|
| user_stats | <i>Returns stats about the movies, shows, and episodes a user has watched, collected, and rated.</i> |
|------------|--|

---

**Description**

Data about a user's interactions with movies, shows, seasons, episodes, as well as their social network (friends, followings, followers) and a frequency table of the user's media ratings so far.

**Usage**

```
user_stats(user = getOption("trakt_username"))
```

**Arguments**

`user` `character(1)`: Target username (or slug). Defaults to `getOption("trakt_username")`. Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined.

**Value**

A list of [tibbles](#) containing the following elements:

- "movies"
- "shows"
- "seasons"
- "episodes"
- "network"
- "ratings"

**Source**

`user_stats()` wraps endpoint [users/:id/stats](#).

**See Also**

## End(Not run)
```

---

|                           |   |
|---------------------------|---|
| <code>user_watched</code> | <i>Get a user's watched shows or movies</i> |
|---------------------------|---|

---

**Description**

For private users, an [authenticated request](#) is required.

**Usage**

```
user_watched(
  user = getOption("trakt_username"),
  type = c("shows", "movies"),
  noseasons = TRUE,
  extended = c("min", "full")
)
```

**Arguments**

|           |  |
|-----------|--|
| user      | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| type      | character(1): Either "shows" or "movies". For season/episode-specific functions, values seasons or episodes are also allowed.  |
| noseasons | logical(1) [TRUE]: Only for type = "show": Exclude detailed season data from output. This is advisable if you do not need per-episode data and want to be nice to the API.   |
| extended  | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

**Value**

A `tibble()`. If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

**Source**

`user_watched()` wraps endpoint `users/:id/watched/:type`.

Other user data: `user_collection()`, `user_comments()`, `user_history()`, `user_likes()`, `user_network()`, `user_profile()`, `user_ratings()`, `user_stats()`, `user_watchlist()`

**Examples**

```
## Not run:
# Use noseasons = TRUE to avoid receiving detailed season/episode data
user_watched(user = "sean", noseasons = TRUE)

## End(Not run)
```

---

|                |                               |
|----------------|-------------------------------|
| user_watchlist | <i>Get a user's watchlist</i> |
|----------------|-------------------------------|

---

**Description**

Get a user's watchlist

## Usage

```
user_watchlist(  
  user = getOption("trakt_username"),  
  type = c("movies", "shows"),  
  extended = c("min", "full")  
)
```

## Arguments

|          |  |
|----------|--|
| user     | character(1): Target username (or slug). Defaults to <code>getOption("trakt_username")</code> . Can also be of length greater than 1, in which case the function is called on all user values separately and the result is combined. |
| type     | character(1): Either "shows" or "movies". For season/episode-specific functions, values seasons or episodes are also allowed.  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details.                                   |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty `tibble()` is returned.

## Source

`user_watchlist()` wraps endpoint [users/:id/watchlist:type](#).

## Examples

```
## Not run:  
# Defaults to movie watchlist and minimal info  
user_watchlist(user = "sean")  
  
## End(Not run)
```

---

|               |                           |
|---------------|---------------------------|
| watched_media | <i>Most watched media</i> |
|---------------|---------------------------|

---

## Description

These functions return the most watched movies/shows on trakt.tv.

## Usage

```
movies_watched(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL
)
```

```
shows_watched(
  limit = 10,
  extended = c("min", "full"),
  period = c("weekly", "monthly", "yearly", "all"),
  query = NULL,
  years = NULL,
  genres = NULL,
  languages = NULL,
  countries = NULL,
  runtimes = NULL,
  ratings = NULL,
  certifications = NULL,
  networks = NULL,
  status = NULL
)
```

## Arguments

|          |  |
|----------|--|
| limit    | integer(1) [10L]: Number of items to return. Must be greater than 0 and will be coerced via <code>as.integer()</code> .  |
| extended | character(1): Either "min" (API default) or "full". The latter returns more variables and should generally only be used if required. See <code>vignette("finding-things")</code> for more details. |

|                |   |
|----------------|---|
| period         | character(1) ["weekly"]: Which period to filter by. Possible values are "weekly", "monthly", "yearly", "all".   |
| query          | character(1): Search string for titles and descriptions. For <code>search_query()</code> other fields are searched depending on the type of media. See <a href="#">the API docs</a> for a full reference.   |
| years          | character   integer: 4-digit year (2010) <b>or</b> range, e.g. "2010-2020". Can also be an integer vector of length two which will be coerced appropriately, e.g. <code>c(2010, 2020)</code> .  |
| genres         | character(n): Genre slug(s). See <a href="#">trakt_genres</a> for a table of genres. Multiple values are allowed and will be concatenated.  |
| languages      | character(n): Two-letter language code(s). Also see <a href="#">trakt_languages</a> for available languages (code and name).  |
| countries      | character(n): Two-letter country code(s). See <a href="#">trakt_countries</a> .   |
| runtimes       | character   integer: Integer range in minutes, e.g. 30-90. Can also be an integer vector of length two which will be coerced appropriately.   |
| ratings        | character   integer: Integer range between 0 and 100. Can also be an integer vector of length two which will be coerced appropriately. Note that user-supplied ratings are in the range of 1 to 10, yet the ratings on the site itself are scaled to the range of 1 to 100. |
| certifications | character(n): Certification(s) like pg-13. Multiple values are allowed. Use <a href="#">trakt_certifications</a> for reference. Note that there are different certifications for shows and movies.  |
| networks       | character(n): (Shows only) Network name like HBO. See <a href="#">trakt_networks</a> for a list of known networks.  |
| status         | character(n): (Shows only) The status of the shows. One of "returning series", "in production", "planned", "canceled", or "ended".  |

## Value

A [tibble\(\)](#). If the function has a `limit` parameter (defaulting to 10), this will be the (maximum) number of rows of the tibble. If there are no results (or the API is unreachable), an empty [tibble\(\)](#) is returned.

## The Dynamic Lists on trakt.tv

These functions access the automatically updated lists provided by trakt.tv. Each function comes in two flavors: Shows or movies. The following descriptions are adapted directly from the [API reference](#).

- **Popular**: Popularity is calculated using the rating percentage and the number of ratings.
- **Trending**: Returns all movies/shows being watched right now. Movies/shows with the most users are returned first.
- **Played**: Returns the most played (a single user can watch multiple times) movies/shows in the specified time period.
- **Watched**: Returns the most watched (unique users) movies/shows in the specified time period.

- **Collected**: Returns the most collected (unique users) movies/shows in the specified time period.
- **Anticipated**: Returns the most anticipated movies/shows based on the number of lists a movie/show appears on. The functions for **Played**, **Watched**, **Collected** and **Played** each return the same additional variables besides the media information: `watcher_count`, `play_count`, `collected_count`, `collector_count`.
